

Journal 2

Paul Edwards

06/03/2021

This week's content was largely revision for me, as I was familiar with most of the coding topics covered. However, I appreciated some of the packages I had not yet used before such as `sjPlot` and `Papaja`. Because of my familiarity I wanted to extend myself with a few simple tricks, such as subsetting rows from a dataframe and customising histograms. I had some issues with setting up the working directory for the `here()` function to work, and then again with pushing updated files to GitHub. After some trial and error, I managed to synch up the files correctly.

I also had the opportunity to offer my limited knowledge to other students. One student had difficulty running a linear model. After some questioning, it turned out that they had used the shortcut for running a selected line (`Ctrl + Enter`) rather than the entire current chunk (`Ctrl + Shift + Enter`). They were attempting to use the `str()` function on a model object that hadn't yet been assigned. Once I showed them the difference, they were able to run the model.
